Cybersecurity Services (safe)

Securing Your Operations: Preventing/Detecting - Control Threads

Build & Enhance Architecture (Designing Security Posture) >>> Solutions

- Conduct a comprehensive and detailed assessment of the networks in terms of efficiency, design, and security.
- Design and implement internal network solutions that ensure the efficient operation and security of the network using designs that suit each working environment, taking advantage of extensive experience in projects and different environments. This includes the use of wired and wireless network switches, firewalls of various types, according to the specifications appropriate for each case.
- Provide improvements to the designs based on the results of the assessment. This improvement includes, for example, activating concepts such as SDWAN and Zero Trust, which allows organizations to be flexible and adapt quickly to modern technologies, thereby increasing the level of security.
- Build plans to implement any improvement or modification to the network designs and follow up on its implementation until comprehensive documentation is obtained, which provides the team with a comprehensive and detailed view of all the network's joints.
- Provide consulting, managed service, training, and awareness programs related to cybersecurity.

Firewalls and Security Systems

- Evaluate, design, provide, and implement firewalls and application firewalls (firewalls, WAF, secure mail gateway, etc.) in accordance with extensive experience in design and implementation.
- MDM.
- Provide and implement antivirus and security systems from various risks (end point security, EDR, XDR, etc.).
- Provide VPN services.
- Provide effective SDWAN solutions and designs.
- Provide identity and access management (IAM & PAM) solutions.
- Provide network access control (NAC) solutions.
- Provide managed services and technical support contracts for all of these systems.
- Provide specialized training for all of these systems.
